PROTECTING VISION · EXTERIOR WILDFIRE DEFENSE

# Fire defense that works while you're away.

Embers and radiant heat reach buildings long before the first fire engine does, and evacuations empty the property at exactly the moment the risk peaks. **Protecting Vision** detects the heat of an approaching fire and turns on its exterior water zones by itself, even when nobody is there.

## HOW IT WORKS

### 1. Detects heat

Small wireless sensors around the property feel fire heat in seconds.

### 2. Turns itself on

The control unit activates the system automatically. Nobody has to flip a switch.

### 3. Wets the exterior

Water zones wet the roofline, the walls and the ground around the building.

## WHAT MAKES IT DIFFERENT

- Works when the property is empty: after hours, on weekends and during evacuations
- Wireless sensors; no Wi-Fi or Bluetooth needed
- Solar-powered sensor and control units
- Activation in under a second in field tests
- Designed and sized for each property

## WHO IT'S FOR

- Homeowners in fire country
- Wineries, farms and ranches
- Commercial buildings and business owners
- Property managers and housing providers
- Builders, HOAs and public agencies

## WHAT A PROJECT LOOKS LIKE

- **Site assessment:** we walk the property, review building size, vegetation and the water source, and identify where protection matters most.
- **Design and quote:** the system is laid out for your property. Every property is different, so pricing is quoted after the assessment.
- **Installation and testing:** installed to code by licensed trades, activation-tested, and handed off with documentation for your records, insurer or lender.
- **Service:** optional annual service plans keep the system ready for fire season.
